BIOPSY

Microscopic Description: The examined spleen contains an expansile fairly discrete hemorrhagic mass composed of mature lymphoid tissue with interstitial plasma cells, hematopoietic cells and hemosiderin laden macrophages, on a background of mild stromal hyperplasia.

Diagnosis: Spleen, nodular hyperplasia.

Comment: Splenic nodular hyperplasia is a benign growth. It has no clinical significance unless it ruptures and causes abdominal hemorrhage. No features of malignancy are seen.

Anna Barthel, DVM, Dipl. ACVP
